# A7146

### Description

The A7146 is a 1.5MHz constant frequency, high efficiency, high current, slope compensated current mode PWM step-down DC-DC converter. The A7146 integrates a main switch and a main switch and a synchronous rectifier for high efficiency without an external schottky diode.

The A7146 provides an adjustable version and fixed output voltage of 1.2V, 1.5V and 1.8V for design flexible.

The A7146 can operate from a 2.5V to 5.5V input voltage and is ideal for powering portable equipment that runs from a single cell lithium-Ion (Li+) battery. The A7146 can supply 1.2A output current and can also run at 100% duty cycle for low dropout operation, extending battery life in portable system. Pulse Skipping Mode operation at light loads provides very low output ripple voltage for noise sensitive application.

The A7146 is availabe10-Pin MSOP and DFN packages.

## **Ordering Information**

#### Features

- 1.5MHz Constant Switching Frequency
- 1.2A Output Current
- High Efficiency: Up to 95%
- 2.5V to 5.5V Input Voltage Range
- Output Voltages from 0.6V to 5V
- Low R<sub>DS(ON)</sub> Internal Switch: 0.12Ω
- Available in Fixed Output Voltages of 1.2V, 1.5V, 1.8V and Adjustable Version
- Allow Use of Ceramic Capacitors
- Current Mode Operation for Excellent Line and Load Transient Response
- Short-Circuit Protected
- Low Dropout Operation: 100% Duty Cycle
- Low Shutdown Current: I<sub>SHUTDOWN</sub><1uA
- Available in 10-Pin MSOP and DFN Package

#### **Application**

- PDA, PMP, DSC
- Cellular and Smart Phones
- Portable Instruments
- Microprocessors and DSP Core Supplies

#### **Detailed Information**

Fig 1. A7146 adjustable output version typical application

Fig 2. A7146 fixed output version typical application

#### **Output Voltage Setting**

Figure 1 shows A7146 adjustable output version typical application and Fig 2. shows A7146 fixed output version typical application. The external resistor sets the output voltage according to the following equation:

$$V_{OUT} = 0.6V \times \left(1 + \frac{R2}{R1}\right)$$

| Advanced Innovation Technology Corp. | Page | 5/12 |
|--------------------------------------|------|------|
| www.ait-ic.com                       | Rev  | 0.9  |

Table 1 shows the resistors selection for output voltage setting.

| V <sub>OUT</sub> | R1 (Ω) | R2 (Ω) |
|------------------|--------|--------|
| 1.2V             | 316K   | 316K   |
| 1.5V             | 316K   | 470K   |
| 1.8V             | 316K   | 634K   |
| 2.5V             | 316K   | 1.0M   |
| 3.3V             | 316K   | 1.43M  |

Table 1. Resistor select for output voltage setting

#### **Inductor Selection**

For most designs, the A7146 operates with inductors of  $1\mu$ H to  $4.7\mu$ H. Low inductance values are physically smaller but require faster switching, which results in some efficiency loss. The inductor value can be derived from the following equation:

$$L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} \times \Delta I_{L} \times f_{OSC}}$$

Where  $\Delta I_L$  is inductor Ripple Current. Large value inductors lower ripple current and small value inductors result in high ripple currents. Choose inductor ripple current approximately 30% of the maximum load current 1200mA, or

## $\Delta I_L$ =360mA.

For output voltages above 2.0V, when light-load efficiency is important, the minimum recommended inductor is 2.2 $\mu$ H. For optimum voltage-positioning load transients, choose an inductor with DC series resistance in the 20m $\Omega$  to 100m $\Omega$  range. For higher efficiency at heavy loads (above 200mA), or minimal load regulation (but some transient overshoot), the resistance should be kept below 100m $\Omega$ . The DC current rating of the inductor should be at least equal to the maximum load current plus half the ripple current to prevent core saturation (1200mA+360mA). Table 2 lists some typical surface mount inductors that meet target applications for the A7146.

Table 2. Typical Surface Mount Inductors

#### **Input Capacitor Selection**

The input capacitor reduces the surge current drawn from the input and switching noise from the A7146device. The input capacitor impedance at the switching frequency should be less than input source impedance to prevent high frequency switching current passing to the input. A low ESR input capacitor sized for maximum RMS current must be used. Ceramic capacitors with X5R or X7R dielectrics are highly recommended because of their low ESR and small temperature coefficients. A 22µF ceramic capacitor for most applications is sufficient. A large value may be used for improved input voltage filtering.

#### **Output Capacitor Selection**

The output capacitor is required to keep the output voltage ripple small and to ensure regulation loop stability. The output capacitor must have low impedance at the switching frequency. Ceramic capacitors with X5R or X7R dielectrics are recommended due to their low ESR and high ripple current ratings. The output ripple  $V_{OUT}$  is determined by:

$$\Delta V_{OUT} \leq \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} \times f_{OSC} \times L} \times \left( ESR + \frac{1}{8 \times f_{osc} \times C3} \right)$$

A 22µF ceramic capacitor can satisfy most applications.

#### Operation

The A7146 is a monolithic switching mode Step-Down DC-DC converter. It utilizes internal MOSFETs to achieve high efficiency and can generate very low output voltage by using internal reference at 0.6V. The A7146 operates at a fixed switching frequency, and uses the slope compensated current mode architecture. This Step-Down DC-DC Converter supplies 1200mA output current at  $V_{IN} = 3V$  with input voltage range from 2.5V to 5.5V. With the Pulse Skipping Mode feature, users can optimize ripple at light load for noise sensitive applications.

| Advanced Innovation Technology Corp. | Page | 7/12 |
|--------------------------------------|------|------|
| www.ait-ic.com                       | Rev  | 0.9  |

#### **Current Mode PWM Control**

Slope compensated current mode PWM control provides stable switching and cycle-by-cycle current limit for excellent load and line responses and protection of the internal main switch (P-ch MOSFET) and synchronous rectifier (N-ch MOSFET). During normal operation, the internal P-ch MOSFET is turned on for a certain time to ramp the inductor current at each rising edge of the internal oscillator, and switched off when the peak inductor current is above the error voltage. The current comparator, I<sub>COMP</sub>, limits the peak inductor current. When the main switch is off, the synchronous rectifier will be turned on immediately and stay on until either the inductor current starts to reverse, as indicated by the current reversal comparator, I<sub>ZERO</sub>, or the beginning of the next clock cycle. The OVDET comparator controls output transient overshoots by turning the main switch off and keeping it off until the fault is no longer present.

#### **Pulse Skipping Mode Operation**

The A7146 can automatically switch to Pulse Skipping Mode operation at light load to improve efficiency. In the Pulse Skipping Mode, the inductor current may reach zero or reverse on each pulse. The PWM control loop will automatically skip pulses to maintain output regulation. The bottom MOSFET is turned off by the current reversal comparator, I<sub>ZERO</sub>, and the switch voltage will ring. This is discontinuous mode operation, and is normal behavior for the switching regulator.

#### **Dropout Operation**

When the input voltage decreases toward the value of the output voltage, the A7146 allows the main switch to remain on for more than one switching cycle and increases the duty cycle until it reaches 100%. The duty cycle D of a step-down converter is defined as:

$$D = T_{ON} \times f_{OSC} \times 100\% \approx \frac{V_{OUT}}{V_{IN}} \times 100\%$$

Where  $T_{ON}$  is the main switch on time and  $f_{OSC}$  is the oscillator frequency. The output voltage then is the input voltage minus the voltage drop across the main switch and the inductor. At low input supply voltage, the  $R_{DS(ON)}$  of the P-channel MOSFET increases, and the efficiency of the converter decreases. Caution must be exercised to ensure the heat dissipated not to exceed the maximum junction temperature of the A7146.

| Advanced Innovation Technology Corp. | Page | 8/12 |
|--------------------------------------|------|------|
| www.ait-ic.com                       | Rev  | 0.9  |

#### **Maximum Load Current**

The A7146 will operate with input supply voltage as low as 2.5V, however, the maximum load current decreases at lower input due to large IR drop on the main switch and synchronous rectifier. The slope compensation signal reduces the peak inductor current as a function of the duty cycle to prevent sub-harmonic oscillations at duty cycles greater than 50%. Conversely the current limit increases as the duty cycle decreases.
